

New function: PARTdataManager component comparison/search

1 You can now start a component comparison by right clicking into the first column of the selection table (number).

Advantages:

- Differences in geometry are immediately clear.
- Decisions about product geometry can be made quickly, for example when aiming to change over to products from the core product range (identified with a star).

2 Upload a product or a component as a native or neutral CAD model. Whether it is about an in-house produced mounting bracket for a cylinder or a cylinder from another manufacturer, you can see straightaway which Festo products have a similar geometry.

(A detailed comparison of geometries in tabular form, for example of the dimensions, is only possible between Festo products.)

Advantages:

- Simplifies the make-or-buy decision, e.g. for accessories like mounting brackets.
- Enables products to be recoded based on their geometry.
